# Disclaimer

The report makes no statements or warranties, either expressed or implied, regarding the security of the code, the information herein or its usage. It also cannot be considered as a sufficient assessment regarding the utility, safety and bugfree status of the code, or any other statements.

This report does not constitute legal or investment advice. It is for informational purposes only and is provided on an "as-is" basis. You acknowledge that any use of this report and the information contained herein is at your own risk. The authors of this report shall not be liable to you or any third parties for any acts or omissions undertaken by you or any third parties based on the information contained herein.

# Terminology

**Code:** The code with which users interact.

**Inherent risk:** A risk for users that comes from a behavior inherent to the code's design.

Inherent risks only represent the risks inherent to the code's design, which are a subset of all the possible risks. **No inherent risk doesn't mean no risk.** It only means that no risk inherent to the code's design has been identified. Other kind of risks could still be present. For example, the issues not fixed incur risks for the users, or the upgradability of the code might also incur risks for the users.

**Issue:** A behavior unexpected by the users or by the project, or a practice that increases the chances of unexpected behaviors to appear.

**Critical issue:** An issue intolerable for the users or the project, that must be addressed.

**Major issue:** An issue undesirable for the users or the project, that we strongly recommend to address.

**Medium issue:** An issue uncomfortable for the users or the project, that we recommend to address.

**Minor issue:** An issue imperceptible for the users or the project, that we advise to address for the overall project security.

# Objective

Our objective is to share everything we have found that would help assessing and improving the safety of the code:

1. The **inherent risks** of the code, labelled R1, R2, etc.
2. The **issues** in the **code**, labelled C1, C2, etc.
3. The **issues** in the **testing** of the code, labelled T1, T2, etc.
4. The **issues** in the **other** parts related to the code, labelled O1, O2, etc.
5. The **recommendations** to address each issue.

# Audit Summary

## Initial scope

- **Repository:**  
<https://github.com/HatomProtocol/hatom-crypto-asset-facilitator>
- **Commit:** c5b9d577f973ce3dccbb7a813cfd4d9c18aa3e11
- **MultiversX smart contract path:** ./crypto-asset-facilitator/

## Final scope

- **Repository:**  
<https://github.com/HatomProtocol/hatom-crypto-asset-facilitator>
- **Commit:** 7e971bdd5ab7d79aa06e2a4acc033c2c5af25938
- **MultiversX smart contract path:** ./crypto-asset-facilitator/

## 2 inherent risks in the final scope

### 0 issue in the final scope

3 issues reported in the initial scope and 0 remaining in the final scope:

Severity	Reported			Remaining		
	Code	Test	Other	Code	Test	Other
Critical	0	0	0	0	0	0
Major	0	0	0	0	0	0
Medium	1	0	0	0	0	0
Minor	2	0	0	0	0	0

# Inherent Risks

## **R1: 1 USH minted by a Crypto Asset Facilitator might be backed by less than \$1 worth of collateral.**

This is because there is a trust that the oracles providing prices and that the liquidation bots are active and work properly:

- If for any reason the prices returned by the oracles are erroneous, then the real dollar value of the collateral of USH borrowers might be smaller than the amount of borrowed USH.
- If for any reason, while some users are insolvent, there are no sufficiently active liquidators to execute liquidations or liquidations fail to be executed (e.g. because prices fail to be obtained from the oracles), then the amount of borrowed USH might continue to increase and exceed the dollar value of the collateral of USH borrowers.

## **R2: The solvency of a user might be incorrectly assessed, possibly leading to bad debt or to the liquidations of solvent users.**

This is because the solvency of a user depends on the value of his collateral relative to the value of his debt, and the prices of these tokens are obtained from external oracles which might make mistake and return incorrect prices. Consequently:

- Insolvent users might be deemed solvent: This would prevent the liquidations of these users, and would also allow them to borrow assets or withdraw collateral. This could then further lead to bad debt, i.e. a situation where USH is not sufficiently backed by collateral, increasing the risk that the dollar value of USH drops below 1.
- Solvent users might be deemed insolvent: This could result in unexpected liquidations, possibly making borrowers lose funds.

# Code Issues & Recommendations

Since the code is not open-source, only the remaining issues are published.
